## 2. GSM TX power class

| <b>TX Power<br/>control level</b> | <b>GSM900</b> | <b>TX Power<br/>control level</b> | <b>DCS1800</b> | <b>TX Power<br/>control level</b> | <b>PCS1900</b> |
|-----------------------------------|---------------|-----------------------------------|----------------|-----------------------------------|----------------|
| 5                                 | 33 ±2 dBm     | 0                                 | 30 ±2 dBm      | 0                                 | 30 ±2 dBm      |
| 6                                 | 31 ±2 dBm     | 1                                 | 28 ±3 dBm      | 1                                 | 28 ±3 dBm      |
| 7                                 | 29 ±2 dBm     | 2                                 | 26 ±3 dBm      | 2                                 | 26 ±3 dBm      |
| 8                                 | 27 ±2 dBm     | 3                                 | 24 ±3 dBm      | 3                                 | 24 ±3 dBm      |
| 9                                 | 25 ±2 dBm     | 4                                 | 22 ±3 dBm      | 4                                 | 22 ±3 dBm      |
| 10                                | 23 ±2 dBm     | 5                                 | 20 ±3 dBm      | 5                                 | 20 ±3 dBm      |
| 11                                | 21 ±2 dBm     | 6                                 | 18 ±3 dBm      | 6                                 | 18 ±3 dBm      |
| 12                                | 19 ±2 dBm     | 7                                 | 16 ±3 dBm      | 7                                 | 16 ±3 dBm      |
| 13                                | 17 ±2 dBm     | 8                                 | 14 ±3 dBm      | 8                                 | 14 ±3 dBm      |
| 14                                | 15 ±2 dBm     | 9                                 | 12 ±4 dBm      | 9                                 | 12 ±4 dBm      |
| 15                                | 13 ±2 dBm     | 10                                | 10 ±4 dBm      | 10                                | 10 ±4 dBm      |
| 16                                | 11 ±3 dBm     | 11                                | 8 ±4dBm        | 11                                | 8 ±4dBm        |
| 17                                | 9 ±3dBm       | 12                                | 6 ±4 dBm       | 12                                | 6 ±4 dBm       |
| 18                                | 7 ±3 dBm      | 13                                | 4 ±4 dBm       | 13                                | 4 ±4 dBm       |
| 19                                | 5 ±3 dBm      | 14                                | 2 ±5 dBm       | 14                                | 2 ±5 dBm       |
|                                   |               | 15                                | 0 ±5 dBm       | 15                                | 0 ±5 dBm       |

---

## 2. SGH-X450 Circuit Description

---

### 1. SGH-X450 RF Circuit Description

#### 1) RX PART

1. **ASM(U201)** → Switching Tx, Rx path for E`GSM900, DCS1800 and PCS1900 by logic controlling.

#### 2. ASM Control Logic (U501, U502, U503) → Truth Table

|                   | VC1 | VC2 | VC3 |
|-------------------|-----|-----|-----|
| GSM Tx Mode       | H   | L   | L   |
| DCS / PCS Tx Mode | L   | H   | L   |
| PCS Rx Mode       | L   | L   | H   |
| GSM / DCS Rx Mode | L   | L   | L   |

#### 3. FILTER

To convert Electromagnetic Field Wave to Acoustic Wave and then pass the specific frequency band.

- GSM FILTER (C220,C221,L204) → For filtering the frequency band between 925 ~ 960 MHz
- DCS FILTER (C218,C219,L203) → For filtering the frequency band 1805 and 1880 MHz.
- PCS SAW FILTER (F200) → For filtering the frequency band between 1930 and 1990 MHz

#### 4. TC-VCXO (OSC100)

To generate the 13MHz reference clock to drive the logic and RF.

After additional process, the reference clock applies to the U100 Rx IQ demodulator and Tx IQ modulator.

The oscillator for RX IQ demodulator and Tx modulator are controlled by serial data to select channel and use fast lock mode for GPRS high class operation.

#### 5. SI 4205 (U100)

This chip integrates three differential-input LNAs.

The GSM input supports the E-GSM, DCS input supports the DCS1800, PCS input supports the PCS1900. The LNA inputs are matched to the 200 ohm differential output SAW filters through eternal LC matching network.

Image-reject mixer downconverts the RF signal to a 100 KHz intermediate frequency(IF) with the RFLO from frequency synthesizer. The RFLO frequency is between 1737.8 ~ 1989.9 MHz.

The Mixer output is amplified with an analog programmable gain amplifier(PGA), which is controlled by AGAIN.

The quadrature IF signal is digitized with high resolution A/D converts (ADC).

Also, this chip down-converts the ADC output to baseband with a digital 100 KHz quadrature LO signal. Digital decimation and IIR filters perform channel selection to remove blocking and reference interface signals.

After channel selection, the digital output is scaled with a digital PGA, which is controlled with the DGAIN. DACs drive a differential analog signal onto the RXIP, RXIN, RXQP, RXQN pins to interface to standard analog-input baseband IC.

## 2) TX PART

Baseband IQ signal fed into offset PLL, this function is included inside of U100 chip.

SI4205 chip generates modulator signal which power level is about 1.5dBm and fed into Power Amplifier(U200).

The PA output power and power ramping are well controlled by Auto Power Control circuit. We use offset PLL below

|                     |                                            |     |        |
|---------------------|--------------------------------------------|-----|--------|
| Modulation Spectrum | 200kHz offset<br>30 kHz bandwidth          | GSM | -35dBc |
|                     |                                            | DCS | -35dBc |
|                     |                                            | PCS | -35dBc |
|                     | 400kHz offset<br>30 kHz bandwidth          | GSM | -66dBc |
|                     |                                            | DCS | -65dBc |
|                     |                                            | PCS | -66dBc |
|                     | 600kHz ~ 1.8MHz offset<br>30 kHz bandwidth | GSM | -75dBc |
|                     |                                            | DCS | -68dBc |
|                     |                                            | PCS | -75dBc |

## 2. Baseband Circuit description of SGH-X450

### 1) PSC2106

#### 1. Power Management

Seven low-dropout regulators designed specifically for GSM applications power the terminal and help ensure optimal system performance and long battery life. A programmable LDO provides support for 1.8V, 3.0V SIMs, while a self-resetting, electronically fused switch supplies power to external accessories. Ancillary support functions, such as two LED drivers and two call-alert drivers, aid in reducing both board area and system complexity. A four-wire serial interface unit(SIU) provides access to control and configuration registers. This interface gives a microprocessor full control of the PSC2106 and enables system designers to maximize both standby and talk times. Error reporting is provided via an interrupt signal and status register. Supervisory functions, including a reset generator, an input voltage monitor, and a thermal monitor, support reliable system design. These functions work together to ensure proper system behavior during start-up or in the event of a fault condition (low microprocessor voltage, insufficient battery energy, or excessive die temperature).

#### 2. Battery Charge Management

A battery charge management block, incorporating an internal PMOS switch, and an 8-bit ADC, provides fast, efficient charging of single-cell Li-Ion battery. Used in conjunction with a current-limited voltage source, this block safely conditions near-dead cells and provides the option of having fast-charge and top-off controlled internally or by the system's microprocessor.

### 3. Backlight LED Driver

The backlight LED driver is a low-side, programmable current source designed to control the brightness of the keyboard and LCD illumination. LED1\_DRV is controlled via LED1\_[0:2] and can be programmed to sink from 15mA to 60mA in 7.5mA steps. LED2\_DRV is controlled via LED2\_[0:2] and can be programmed to sink from 5mA to 40mA in 5mA steps. Both LED drivers are capable of sinking their maximum output current at a worst-case maximum output voltage of 0.6V. For efficient use, the LEDs is connected between the battery and the LED\_DRV output.

### 4. Vibrator Motor Driver

The vibrator motor driver is a low-side, programmable voltage source designed to drive a small dc motor that silently alerts the user of an incoming call. The driver is controlled by VIB[0:1] and can be programmed to maintain a motor voltage of 1.3V, 2.0V, or 2.5V(relative to VBAT) while sinking up to 100mA. For efficient use, the vibrator motor should be connected between the main battery and the VIB\_DRV output.

## 2) Connector

### 1. LCD Connector

LCD is consisted of main LCD(color 65K UFB LCD). Chip select signals of EMI part in the trident, CLCD\_EN, can enable main LCD. LED\_EN signal enables white LED of main LCD and EL\_EN signal enables dimming mode of main LCD.

These two signals are from IO part of the DSP in the trident. RST signal from 2106 initiates the initial process of the LCD.

16-bit data lines(D(0)~D(15)) transfers data and commands to LCD through emi\_filter. Data and commands use A(2) signal. If this signal is high, Inputs to LCD are commands. If it is low, Inputs to LCD are data. The signal which informs the input or output state to LCD, is required. But this system is not necessary this signal. So CP\_WEN signal is used to write data or commands to LCD.

Power signals for LCD are +VBATT and VCCD.

SPK1P and SPK1N from CSP1093 are used for audio speaker. And YMU\_VIB\_EN from MA-3 enables the motor.

### 2. JTAG Connector

Trident has two JTAG ports which are for ARM core and DSP core(DSP16000). So this system has two port connector for these ports. Pins' initials for ARM core are 'CP\_' and pins' initials for DSP core are 'DSP\_'.

CP\_TDI and DSP\_TDI signal are used for input of data. CP\_TDO and DSP\_TDO signals are used for the output of the data. CP\_TCK and DSP\_TCK signals are used for clock because JTAG communication is a synchronous. CP\_TMS and DSP\_TMS signals are test mode signals. The difference between these is the RESET\_INT signal which is for ARM core RESET.

### 3. Keypad connector

This is consisted of key interface pins in the trident, KEY\_ROW[0~4] and KEY\_COL[0~4]. These signals compose the matrix. Result of matrix informs the key status to key interface in the trident. Some pins are connected to varistor for ESD protection. And power on/off key is separated from the matrix.

So power on/off signal is connected with PSC2106 to enable PSC2106. SVC\_GREEN, SVC\_RED and SVC\_BLUE are from OCTL of CSP1093.

These signals decide the color of LED, service indicator.

Nine key LED use the +VBATT supply voltage. These are connected to BACKLIGHT signal in the PSC2106.

This signal enables LEDs with current control. FLIP\_SNS informs the status of folder (open or closed) to the trident. This uses the hall effect IC, A3210ELH.

A magnet under main LCD enables A3210ELH which is on the main PCB.

### 4. EMI Filtering

This system uses the EMI Filter to reduce noise from LCD part. Some control signals are connected to LCD without EMI filtering.

### 3) IF connetor

It is 23-pin connector, and uses 18-pin at present. They are designed to use SDS, DEBUG, DLC-DETECT, JIG\_ON, VEXT, VTEST, VF, +VBATT and GND. They connected to power supply IC, microprocessor and signal processor IC.

### 4) Audio

AOUTAP, AOUTAN from CSP1093 is connected to the speaker via analog switch. AOUTBP and AOUTBN are connected to the ear-mic speaker via ear-jack. MICIN and MICOUT are connected to the main MIC. And AUXIN and AUXOUT are connected to the Ear-mic.

YMU762MA3 is a LSI for portable telephone that is capable of playing high quality music by utilizing FM synthesizer and ADPCM decoder that are included in this device.

As a synthesis, YMU762MA3 is equipped 16 voices with different tones. Since the device is capable of simultaneously generating up to synchronous with the play of the FM synthesizer, various sampled voices can be used as sound effects. Since the play data of YMU762MA3 are interpreted at anytime through FIFO, the length of the data (playing period) is not limited, so the device can flexibly support application such as incoming call melody music distribution service.

The hardware sequencer built in this device allows playing of the complex music without giving excessive load to the CPU of the portable telephones. Moreover, the registers of the FM synthesizer can be operated directly for real time sound generation, allowing, for example, utilization of various sound effects when using the game software installed in the portable telephone.

YMU762 includes a speaker amplifier with high ripple removal rate whose maximum output is 550mW (SPVDD=3.6V). The device is also equipped with conventional function including a vibrator and a circuit for controlling LEDs synchronous with music.

For the headphone, it is provided with a stereophonic output terminal.

For the purpose of enabling YMU762MA3 to demonstrate its full capabilities, Yamaha purpose to use "SMAF:Synthetic music Mobile Application Format" as a data distribution format that is compatible with multimedia. Since the SMAF takes a structure that sets importance on the synchronization between sound and images, various contents can be written into it including incoming call melody with words that can be used for training karaoke, and commercial channel that combines texts, images and sounds, and others. The hardware sequencer of YMU762MA3 directly interprets and plays blocks relevant to synthesis (playing music and reproducing ADPCM with FM synthesizer) that are included in data distributed in SMAF.

## 5) Memory

This system uses SHARP's memory, LRS1828.

It is consisted of 128M bits flash memory and 32M bits SCRAM. It has 16 bit data line, D[0~15] which is connected to trident, LCD or CSP1093. It has 22 bit address lines, A[1~22]. They are connected too. CP\_CSROMEN and CO\_CSROM2EN signals, chip select signals in the trident enable two memories. They use 3 volt supply voltage, VCCD. During writing process, CP\_WEN is low and it enables writing process to flash memory and SCRAM. During reading process, CP\_OEN is low and it output information which is located at the address from the trident in the flash memory or SCRAM to data lines. Each chip select signals in the trident select memory among 2 flash memory and SCRAM. Reading or writing procedure is processed after CP\_WEN or CP\_OEN is enabled. Memories use FLASH\_RESET, which is buffered signal of RESET from PSC2106, for ESD protection. A[0] signal enables lower byte of SCRAM and UPPER\_BYTE signal enables higher byte of SCRAM.

## 6) Trident

Trident is consisted of ARM core and DSP core. It has 20K\*16bits RAM 144K\*16bits ROM in the DSP. It has 4K\*32bits ROM and 2K\*32bits RAM in the ARM core. DSP is consisted of timer, one bit input/output unit(BIO), JTAG, EMI and HDS(Hardware Development System). ARM core is consisted of EMI, PIC(Programmable Interrupt Controller), reset/power/clock unit, DMA controller, TIC(Test Interface Controller), peripheral bridge, PPI, SSI(Synchronous Serial Interface), ACCs(Asynchronous communications controllers), timer, ADC, RTC(Real-Time Clock) and keyboard interface. DSP\_AB[0~8], address lines of DSP core and DSP\_DB[0~15], data lines of DSP core are connected to CSP1093. A[0~20], address lines of ARM core and D[0~15], data lines of ARM core are connected to memory, LCD and YMU762. ICP(Interprocessor Communication Port) controls the communication between ARM core and DSP core. CSROMEN, CSRAMEN and CS1N to CS4N in the ARM core are connected to each memory. WEN and OEN control the process of memory. External IRQ(Interrupt ReQuest) signals from each units, such as, YMU, Ear-jack, Ear-mic and CSP1093, need the compatible process.

Some PPI pins has many special functions. CP\_KB[0~9] receive the status from key FPCB and are used for the communications using data link cable(DEBUG\_DTR/RTS/TXD/RXD/CTS/DSR).

And UP\_CS/SCLK/SDI, control signals for PSC2106 are outputted through PPI pins. It has signal port for charging(CHG\_DET), SIM\_RESET and FLIP\_SNS with which we know open/closed status of folder. It has JTAG control pins(TDI/TDO/TCK) for ARM core and DSP core. It receives 13MHz clock in CKI pin from external TCXO and receives 32.768KHz clock from X1RTC. ADC(Analog to Digital Converter) part receives the status of temperature, battery type and battery voltage. And control signals(DSP\_INT, DSP\_IO and DSP\_RWN) for DSP core are used. It enables main LCD with DSP IP pins.

## 7) CSP1093

CSP1093 integrates the timing and control functions for GSM 2+ mobile application with the ADC and DAC functions. The CSP1093 interfaces to the trident, via a 16-bit parallel interface. It serves as the interface that connects a DSP to the RF circuitry in a GSM 2+ mobile telephone. DSP can load 148 bits of burst data into CSP1093's internal register, and program CSP1093's event timing and control register with the exact time to send the burst. When the timing portion of the event timing and control register matches the internal quarter-bit counter and internal frame counter, the 148 bits in the internal

Register are GMSK modulated according to GSM 2+ standards. The resulting phase information is translated into I and Q differential output voltages that can be connected directly to an RF modulator at the TXOP and TXON pins. The DSP is notified when the transmission is completed. For receiving baseband data, a DSP can program CSP1093's event timing and control register with the exact time to start receiving I and Q samples through TXIP and TXIN pins. When that time is reached, the control portion of the event timing and control register will start the baseband receive section converting I and Q sample pairs. The samples are stored in a double-buffered register until the register contains 32 sample pairs. CSP1093 then notifies the DSP which has ample time to read the information out before the next 32 sample pairs are stored. The voice band ADC converter issues an interrupt to the DSP whenever it finishes converting a 16-bit PCM word. The DSP then reads the new input sample and simultaneously loads the voice band output DAC converter with a new PCM output word. The voice band output can be connected directly to a speaker via AOUTAN and AOUTAP pins and be connected to a Ear-mic speaker via AOUTBN and AOUTBP pins.

## 8) X-TAL(13MHz)

This system uses the 13MHz TCXO, TCO-9141B, Toyocom. AFC control signal from CSP1093 controls frequency from 13MHz x-tal. It generates the clock frequency. This clock is fed to CSP1093, Trident, YMU762 and Silab solution.
